Business Insights and Strategic Findings

1. Digital/Online Adoption Is Very Low – But So Is Fraud Risk?

- Swipe transactions dominate revenue ($46M), while Chip is far behind ($17M), and online is minimal ($3M).
- Insight: Customers strongly prefer physical card usage over digital.
  - Opportunity: Promote online/contactless payments (loyalty bonuses, cashback).
  - Risk: Low online usage may mean weak digital infrastructure or an older, tech-averse customer base.

---

2. Spending Patterns: Necessities vs. Discretionary

- Bills ($14M) > Entertainment ($10M) > Fuel & Grocery (~$9M each).
- Insight: Core spending is practical (bills, groceries, fuel). Entertainment is still strong, but travel is relatively low ($6M).
  - Implication: Recession-resistant portfolio, but limited high-ticket discretionary spend.

---

3. Education & Revenue – Diminishing Returns After Graduate Level?

- Graduates = $22M (highest), but post-graduate ($3M) and Doctorate ($2M) are much lower.
- Insight: Higher education does not always mean higher credit card spend.
  - Possible reasons: Post-grads/doctorates may be younger (students/postdocs) or more frugal/saving-focused.
  - Strategy: Target graduates with premium cards, not necessarily PhDs.

---

4. Customer Acquisition Cost (CAC) vs. Card Tier

- Blue card has highest CAC ($6M), followed by Silver ($2M), Gold & Platinum ($1M each).
- Insight: Likely mismatched—Blue is lower tier but costs the most to acquire.

- Possible cause: High volume of blue card acquisitions (mass marketing).
- Recommendation: Shift acquisition budget toward Gold/Platinum if they generate higher lifetime value, or streamline blue acquisition costs.

---

5. Salary Group vs. Revenue – Inverse Relationship?

- Low salary group = $10M revenue
- Med salary group = $8M
- High salary group = $7M
- Insight: Lower-income customers generate higher revenue.
  - Explanation: They may use credit for daily needs, carry balances (interest income), or have multiple cards.
  - High earners might pay in full monthly, use debit, or have premium cards elsewhere.

---

6. Marital Status – Married Customers Drive Majority

- Married = $28M, Single = $23M.
- Insight: Married customers spend more—likely on shared household expenses (bills, groceries, fuel).
  - Implication: Targeting family-oriented rewards (grocery cashback, utility bill points) could boost spend further.

---

7. Gender & State Insights (Top 5 States)

- TX, NY, CA lead with $13M each, but gender split varies:
  - TX & NY: 6F / 7M
  - CA: 7F / 6M
  - FL: $10M (4F / 6M)
  - NJ: $5M (2F / 3M)
- Insight:
  - Top 3 states are nearly equal in revenue, but CA has slightly more female-driven revenue.

  - NJ underperforms vs. population size – possible lower card penetration or competition.
  - Gender balance is close overall, suggesting no extreme gender skew in spending.

---

8. Job Type – Entrepreneurs & White-Collar Lead

- Businessman = $17M (highest)
- White-collar = $10M
- Self-employed, Govt, Blue-collar = $7–8M
- Retirees = $5M (lowest)
- Insight: Business owners spend most. Retirees likely use cash or debit.
  - Strategy: Offer business credit cards or expense management features to self-employed/businessman segment.

Strategic Summary

Insight	Action
Low online usage	Promote digital payments with incentives
High spends by low salary group	Optimize interest income, avoid over-lending risk
Graduate > Post-grad/Doctorate	Target graduates for premium cards, not higher degrees
Blue card CAC too high	Reassess acquisition channels; shift budget to Gold/Platinum
Married customers dominate	Design family + household rewards
Top 3 states equal revenue	Maintain, but investigate NJ for growth
Businessmen highest spend	Launch business card features
